laboratory grown diamond is classified

This Chemical Vapor Deposition (CVD) laboratory grown diamond is classified as Type IIa

The Laboratory Grown Diamond (LGD) described in this Report has been analyzed, graded, and LaesGrübed3 by International Gemological Institute (GB). A LGD has essentially the same chemical, physica and optical properties as a mitted diamond, with the exception of being mam-mode (a manufactures). product). IcDs are typically produced by CVD (chemical vegor deposition) or being installable to imministrational products. IcDs are typically produced by CVD (chemical vegor deposition) or by HPHT (high pressure high temperature) growth processes and may include post-growth modifications to change the color. IcB utilizes the most advanced techniques and equipment currently available including, blinacular microscopes, diamond color imaters, non-contact-polical measuring devices, a wide range of analytical techniques including FIIR (VVENIR), ramon spectroscopy, and fluorescence analysis at various excitation wavelengths. This Report includes advanced security features. This Report is neither a guarantee, valuation nor appraisand by making this report IGI does not agree to purchase or replace the article.
